

Textraw®

“Beauty That Lasts”

Textraw is a patented, premium synthetic ground cover that offers multiple advantages over other natural and synthetic covers on the market today. These advantages are evident in the areas of **Value, Appearance, Plant Health, Human Health, and Environmental Responsibility.**

Appearance

- Looks great every day, year after year.
- Designed to look like beautifully fresh long leaf pine straw, offering the cleanest and most attractive appearance available in ground cover.
- Each straw is quality controlled for color, avoiding the patchy look created by the inconsistency of quality and freshness throughout the depth of natural cover applications. No sticks, cones, or other trash introduced into landscape.
- The product can be fluffed to maintain the fullness of the original application, unlike natural straw that becomes brittle as it decomposes.
- Individual straws interlock better than natural covers, providing more resistance to wind and rain spread.
- Individual straw design disperses moisture away from dwellings, and directly into the soil. By not trapping the moisture at the surface, like natural covers, plant and tree roots do not have to resurface for water, and unsightly mold and mildew growth is discouraged along foundations and walk ways.
- Plants and trees are healthier, thus more beautiful. More time is available for new projects, instead of replacing old ground cover.
- Stay Put, an environmentally friendly adhesive, can be applied to the synthetic straw, holding it in place through storm, wind, or leaf blower. Stay Put only has to be applied once every two-three years, and the bond can be easily broken for flexibility in planting.
- Beds can be blown to remove leaves, and water hosed to remove dirt or animal waste.
