

Textraw®

“Beauty That Lasts”

Textraw is a patented, premium synthetic ground cover that offers multiple advantages over other natural and synthetic covers on the market today. These advantages are evident in the areas of **Value, Appearance, Plant Health, Human Health, and Environmental Responsibility.**

Plant Health

- Moisture is dispersed uninhibited to the soil, not trapped at the surface by natural covers, or even prevented from reaching the soil by some rubber mulches. This allows roots to remain deep with less stress.
- Fewer weeds because new weeds are not being introduced with every replacement application.
- Lower harmful chemical usage around plantings since there are fewer weeds to kill.
- Photo decays, rather than bio decays, eliminating possibility of harmful toxins leaching into the soil. Chemical leaching is a specific concern with some rubber synthetics.
- Removes dark, moist environment, fostered by other covers, which draw insects that breed, and then feed on plants.
- Allows efficient dispersion of fertilizers to the soil, unlike other products that create a surface barrier.
- Eliminates environment favored by mold, mildew, and fungi that attack plants.
- Less time spent replacing ground cover allows more time for attending to plant needs.
- Saves forest trees by reducing harvesting for mulch.
