

Textraw®

“Beauty That Lasts”

Textraw is a patented, premium synthetic ground cover that offers multiple advantages over other natural and synthetic covers on the market today. These advantages are evident in the areas of **Value, Appearance, Plant Health, Human Health, and Environmental Responsibility.**

Value

- One application lasts for multiple years, unlike natural covers that incur product and labor costs as often as 3 times each year.
- Color is guaranteed for 4 years, with life of the product being extended many years more by flipping and fluffing the top and bottom layers.
- Color is infused within the polymer, never needing “touch up” dyes and sprays to maintain appearance through the life of the product, unlike many natural and synthetic mulches.
- Needing only maintenance during an extended life cycle instead of replacement, long term costs are typically 30% less than the cheapest natural cover, pine straw. Cost savings are much greater when compared to the other natural and synthetic covers.
- Chemicals and moisture are not absorbed by the cover, meaning more efficient treatments. Also, new weed and grass seeds, as well as new insects, are not introduced as happens with every replacement of the natural covers.
- Damaging insects, like termites and cockroaches, do not find the food and fertile breeding environment that draws them to the natural covers, creating an indirect insect buffer around dwellings.
- Highly resistant to mold and mildew, unlike natural covers.
- Packaged in an individual 25 lb. roll, 50 square feet can be covered to a dept of 3 ½ inches. Every straw is the color of fresh long leaf pine straw, avoiding the problem of inconsistent quality and freshness of natural covers.
- Investing in Textraw is investing in a product that looks great every day, year after year.
